Candidate Project

April 2022

PROJECT DETAILS

Health Center Patient Demand Profiler

- We are building a tool to help health centers manage workloads.
- Our R&D team has built a great predictive algorithm that creates a profile of the number of patients (booked and walk-in) that will be coming in a week ahead.
- We want to use this capability to allow the charge nurse to be able to view and drill into this demand profile.

PROJECT REQUIREMENTS

Task:

- Please develop a set of designs that walk through your solution to this problem, as well as a set of features (user stories) you would use to communicate with the development team.

Notes:

- Bonus points if you add a mobile component.
- You can use any technology or technique to communicate your solution.
- You can assume an existing application is in place. This is a new capability that will be added on.
- Feel free to ask if you have any questions.
